

## Fork Positioner for Forklifts

Forklift Fork Positioners - A fork positioner is actually a tool made out of top quality materials intended to withstand the most difficult operations and work environments. This particular piece of equipment enables the one driving to maneuver the forks hydraulically without leaving the seat. Side shifting units have the extra ability to be able to laterally position the arms or the entire load in order to facilitate much more exact lifting and placement in a quicker and much more efficient method.

The blade pocket is somewhat unique and could enable the operator to be able to securely sway the forks into position without any fear of destroying the positioning cylinders. This allows the driver the choice to execute simultaneous or independent fork movement, depending on the requirements of the job. For most lift trucks with non-OEM carriages, complete carriages are required. Standard OEM carriages could be transformed into blade positioners on existing units.
