

Used Forklift Parts

Used Forklift Parts - In the long run, lift truck components would wear and should be replaced. Acquiring new components can become a pricey venture so one more idea is to buy used forklift components. This could save much cash in the long run. It is a good idea to purchase used forklift components that have been remanufactured. These components will ensure that you are getting parts which will work for a long time and be productive.

Worn or broken parts which are reproduced are a less expensive solution compared to rebuilding. With rebuilding components, only the components which are broken or worn out get changed, which means that other wearable components may break down soon after purchase.

Remanufacturing on the other hand offers the best guarantee for second-hand components. Remanufactured components are taken apart and cleaned and then all wearable pieces are changed. All wearable parts are replaced regardless of age or wear which is one more reason why reproduced components overall perform so much better. Whichever part within the part is new and this provides much longer life to the second-hand part. Depending on the lift truck parts that are being redone, the cleaning process and the whole remanufacturing process would differ.

The engines are cleaned after a complete disassembly. Different engine parts like rings, pistons, spark plugs, valve springs, filters, and valves can be replaced during the process of remanufacturing. The engines are hot tested after reassembly to guarantee that there are no noise, no oil pressure problems, no leaks or any vacuum.

Transmissions are oven cleaned, pressure washed, and disassembled. A comprehensive inspection is done to be able to check for any cracks. Seals, bearings and bushings are all replaced. Usually, the replacement parts utilized on transmission parts meet OEM specifications.

Some parts like for example the water pump, torque converters, the alternator, steer axles and the starter could obtain longer serviceability after being remanufactured and having all wearable parts replaced. The electronic control in the electric lift truck is maintained by the control card. This card can also be reproduced with replacing all aged and worn out components. Unlike other forklift components the control card could only have the worn and aged parts replaced.

Parts that are remanufactured have to be thoroughly inspected upon reassembly to guarantee they are in good condition before being sold. When buying these components, it is a good idea to make sure that they have undergone all of the proper testing and inspections. On certain bigger parts such as transmissions, steer axles and engines, OEM specification replacement parts should be utilized.

The dealer of used forklifts and components can ensure that the reproduced components have met OEM specifications and that these components meet industry standards. A lot of details go into remanufacturing used components. This attention to detail provides more serviceability out of remanufactured components compared to the components that were simply rebuilt.
